Index

1. Installation.....	3
----------------------	---

1. Installation

Due to the high number of files added or modified for VAM 2.6, in this version there is no separated updater. All the files to be used are part of the installation.

Before upgrade your VAM system it is recommended to make a backup of your Data base and all your files (vam and vamcore folders)

1. Apply in your data base:
 - db_script_to_upgrade_from_VAM_2.5.2.sql
2. Delete your vamcore folder and replace it with the new one.
3. Recover again the database connection in your vamcore\app\Config\database.php file.
4. Copy all the files and folder from the installer folder vam to your vam folder except db_login.php that contains your DB connection.

IMPORTANT! The main pages of VAM (home page for the VA and home page for the logged pilot) have a lot of changes. Now the navbar with links, the body and the footer are separated each other. On those pages you probably have done your own changes, so you have to merge them. It was needed to split those parts of main pages in order to separate different sections.

Tutorial how to merge VAM files: <https://www.youtube.com/watch?v=7UomjuqGEvw>

IMPORTANT! If you have the custom.css customized for your VA, please take care to do not overwrite your version.

IMPORTANT! The following sections are now part of the configuration, the content is added via the admin panel. Please read about that in the VAM documentation. Now you can transfer the content of your php modified to dynamic web content with this new enhancement.

- Welcome message in the home page
- Staff
- Rules
- School

IMPORTANT! After complete the update, clean your browser cache to retrieve the new java scripts.

Enjoy VAM and happy virtual flights.
